DIMENSIONS

OPERATING PRINCIPLES

Electrochemical sensor

When CO goes through an electrolyte solution, it intercedes in the reactions of electrolyse and produces an increase of the quantity of produced electrons. The source electrons of a current which is around microampere are directly proportional to CO concentration.

Thermometer : NTC probe

Negative temperature coefficient probes are thermistors with a resistance that decreases with temperature according to the equation below:

$$R_{(T)} = R_{(T_0)} e^{\left(\frac{\alpha}{100} \times (T_0 + 273.15)^2 \times \left(\frac{1}{T + 273.5} - \frac{1}{T_0 + 273.5} \right) \right)}$$

R_T = resistance sensor value at temperature T

$R(T_0)$ = resistance sensor value at reference temperature T_0

T and T_0 in °C

α et T_0 sensor specific constants
