Polarization Index

Polarization Index is one of the factors to check the condition of insulation. The polarization Index is defined as the ratio between the resistance value in 10 minutes and the resistance value in 1 minute after switch is on.

Calculation formula :

Polarization Index = resistance value in 10 minutes (TIME2) / resistance value in 1 minute (TIME1)

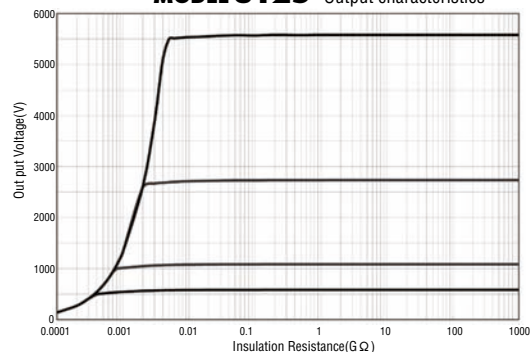

Setting interval is as follows.

TIME1 00:10~59:30 TIME2 00:20~60:00 (Remarks : 00:10 means 10 seconds)

Since polarization Index varies with moisture absorption regardless of the shape or size of insulator, it gives significant criteria to verify the insulation. Following table shows the criteria.

Polarization index	4 or more	4.0~1.5	1.5~1.0	1.0 or less
Criteria	Very good	Good	Dubious	Unsatisfactory

Safety Warnings :

Please read the "Safety Warnings" in the instruction manual supplied with the instrument thoroughly and completely for correct use. Failure to follow the safety rules can cause fire, trouble, electrical shock, etc. Therefore, make sure to operate the instrument on a correct power supply and voltage rating marked on each instrument.
